1. Introduction

Biogeochemical properties of seawater have been routinely measured between Japan and the Japanese Antarctic Station Syowa (69°00'S, 39°35'E) as part of the monitoring program of the Japanese Antarctic Research Expedition (JARE), which is conducted each austral summer season (December–March) along regular routes across the Indian Ocean sector of the Southern Ocean. During JARE cruises, data have been collected both in the open ocean, and, since the 52nd JARE (2010–2011), in areas of sea ice off Syowa Station in Lützow-Holm Bay.

This report presents biogeochemical data acquired from the JARE-56 cruise (2014–2015). The dataset is composed of two series of data: (1) vertical profile data from samples collected at routine monitoring stations along a meridional transect at 110°E and from samples collected in Lützow-Holm Bay, and (2) data from surface water samples obtained along cruise tracks to confirm spatial variations in biogeochemical properties.

2. Sampling

Biogeochemical data presented in this report include temperature and salinity (measured by a sensor probe) and inorganic nutrients and chlorophyll *a* (Chl *a*) concentrations (measured by water analysis). All seawater samples and auxiliary data were taken from the icebreaker *Shirase* during the JARE-56 cruise. The sampling stations are shown in [Figure 1](#).

2.1. Vertical profile sampling

Seawater samples and auxiliary data for vertical profiles were taken at monitoring stations along 110°E (solid squares along L1–L5 transect, [Fig. 1](#)) in December 2014 and in Lützow-Holm Bay (solid squares along A–BP transect, [Fig. 1](#)) during January–February 2015. Sampling at station D (planned in the pack-ice zone) was canceled because of the extreme narrowness of the pack-ice zone. At the time of sampling, station A was located in the multi-year fast-ice zone, and station B was located in the first-year fast-ice zone. Station C was located in the pack-ice zone ([Fig. 1](#)). Details of sampling in the sea-ice area are given in Takahashi *et al.* (2012, 2014).

Vertical temperature and salinity profiles were measured to a depth of 500 m using a conductivity–temperature–depth (CTD) memory probe (SBE 19 plus; Sea-Bird Electronics, Inc.) attached to a water sampler (SBE 55 ECO; Sea-Bird Electronics, Inc.). The data were downloaded from the CTD to a laptop computer immediately after each cast. The CTD sensor was calibrated by the manufacturer prior to the cruise. Note that the salinity data in this report were not corrected by the bottle salinity data measured by the salinometer. Salinity data at station C are unavailable because of salinity sensor probe difficulties.

Seawater was sampled to a depth of 400 m or to the bottom depth (whichever was less) during the down cast using a standard 4-L Niskin bottle (Sea-Bird Electronics, Inc.). Sampling was conducted at depths of 20, 50, 75, 100, 200, and 400 m at stations L1–L5 and E–BP; at 5, 10, 20, 35, 50, and 70 m at station A; and at 10, 20, 50, 75, 100, and 130 m at station B. Seawater at 0 m was collected from the deck using a 5-L polyethylene bucket. No seawater samples were collected from 50, 100, and 200 m at station C because of Niskin bottle sample difficulties caused by seawater temperatures that were near the freezing point.

Seawater was subsampled into 10-mL polyethylene screw-cap vials and 250-mL high-density polyethylene (HDPE) screw-cap, light-blocking bottles for analysis of concentrations of inorganic nutrients and Chl *a*, respectively. After subsampling, seawater samples for nutrient analysis were immediately stored in an ultra-low-temperature freezer (-85°C) until analysis on land. Phytoplankton Chl *a* was extracted by N,N-Dimethylformamide (Suzuki and Ishimaru, 1990) just after filtering the seawater through a glass fiber filter (GF/F; Whatman), and the samples were stored in a freezer (-18°C) until analysis on board the research vessel.

2.2. Underway sampling

Underway surface water sampling was conducted during the cruise. Seawater was continuously pumped from 10 m below the sea surface to an on-board laboratory, and the inlet seawater temperature and salinity were quasi-continuously measured by sensor probes (SBE 38 for temperature and SBE 45 for salinity; Sea-Bird Electronics, Inc.). Inorganic nutrients and Chl *a* were analyzed from samples collected manually 2–3 times per day from the seawater outlet in the laboratory; samples were treated in the same manner as the bottle samples collected in the vertical profiles.

3. Analysis

Concentrations of Chl *a* were determined fluorometrically (Parsons *et al.*, 1984) using an on-board fluorometer (10-AU; Turner Designs, Sunnyvale). The fluorometer was calibrated against a Chl *a* standard (Wako Chemical Co.) at a laboratory on land prior to the cruise with a spectrophotometer and the specific absorption coefficient of Chl *a* (Porra *et al.*, 1989).

The samples for the nutrient concentration analyses were frozen and transported to a laboratory at the Tokyo University of Marine Science and Technology, Japan, via the National Institute of Polar Research, Japan. The frozen samples were thawed to room temperature starting the day before the analyses. Concentrations of the nutrients $\text{NO}_3 + \text{NO}_2$, PO_4 , SiO_2 , and NO_2 were determined using an autoanalyzer (QuAAstro2-HR; BL-TEC K. K.), according to the Joint Global Ocean Flux Study colorimetric analysis methods (JGOFS, 1994). The nutrient concentrations were calibrated against KANSO reference materials (BU, BV, BW, BY, BZ, and CA; KANSO Technos Co., Ltd.).

4. Results

[Table 1](#) lists all information about sampling at the routine monitoring stations. [Figure 2](#) shows vertical profiles of temperature and salinity at each monitoring station, and [Table 2](#) lists bottle analysis data along with CTD data at defined depths. [Table 3](#) shows underway water sampling analysis data and sampling information.

5. Data archive

The data presented in this report are archived and available as a comma-separated values (csv) file from the web site <http://biows.nipr.ac.jp/JARE/>. Permission to use these data for publication or presentation should be obtained in writing. Inquiries about details of the data record should be addressed to:
