## 1. Introduction

In order to clarify the distribution and variation of the sources and sinks of atmospheric CO<sub>2</sub> and to predict future levels of the CO<sub>2</sub> concentration quantitatively, precise observations of the atmospheric CO<sub>2</sub> concentration have been required for many years. For this purpose, systematic measurements of the CO<sub>2</sub> concentration have been extended to a lot of ground-fixed stations around the world, either by continuous sampling with an *in-situ* analyzer or by discrete flask sampling with subsequent laboratory analysis. *In-situ* continuous CO<sub>2</sub> measurements at Syowa Station started in February 1984 have been continued to the present. We have already shown that Syowa Station is a suitable site for monitoring background values of the atmospheric CO<sub>2</sub> concentration, because there are no local and regional effects due to land vegetation and industrial activities around Antarctica (Tanaka et al., 1987; Nakazawa et al., 1991; Aoki and Nakazawa, 1997; Murayama et al., 1997). In this report, we will show the daily and monthly averaged values of the CO<sub>2</sub> concentration observed for the period from February 1984 to January 1992. The CO<sub>2</sub> data obtained after February, 1992 will be published as a series of this report at a later date.

## 2. Instrumentation

Since detailed descriptions of our continuous measurement system have been given elsewhere (Tanaka et al., 1987; Nakazawa et al., 1991), only a brief description will be given here.

Air intake was mounted at the top of an 8 m-height mast at the coastline of Syowa Station (Fig. 1), facing toward the prevailing winds. Air sample was introduced into the continuous measurement system by pumping through a copper tube from the air intake. Water vapor and aerosol particles were removed from the air sample by a cold trap at -60 °C and 1  $\mu\text{m}$  membrane filters, respectively. The atmospheric CO<sub>2</sub> concentration was determined using a non-dispersive infrared (NDIR) CO<sub>2</sub> analyzer with a precision of 0.01 ppmv. Three kinds of working standard gases, high, middle and low gases, were prepared for the continuous measurement; the high and low gases were analyzed every 30 minutes to calibrate the NDIR analyzer and the middle gas every 10 days to examine a non-linear response of the analyzer. The standard gases were shipped to Syowa Station every year to exchange for the old ones. The CO<sub>2</sub> concentrations of the standard gases were determined 4 times and once before and after their usage, respectively, with a precision of 0.01 ppmv by using our secondary standard gas system. Concentration drifts of the working standards during the usage were confirmed to be within 0.1 ppmv. Therefore, overall precision of our continuous measurement of the CO<sub>2</sub> concentration at Syowa Station is within 0.1 ppmv.

### 3. Data

Eight data per hour were obtained by the continuous measurement, so that a total of 547,118 data were recorded from February 1984 to January 1992. To eliminate locally contaminated data, which were presumably originated from station activities, we applied a simple statistical data selection scheme to the raw data set. We first calculated hourly mean values from the individual concentration data for each day. Provisional daily means were calculated using the hourly means of which the standard deviation were less than 0.1 ppmv. Then, we rejected the raw data deviating by more than 0.3 ppmv from the daily means and calculated the hourly and daily means again. This data selection scheme was applied to the raw data set, so that 18,525 data, 3.4 % of all data, were rejected as outliers. Figure 2 and Table 1 show the daily mean CO<sub>2</sub> concentrations, thus obtained. Also shown in Table 1 are numbers of selected and total data and standard deviations of the daily mean values. Table 2 shows monthly mean values and standard deviations of the CO<sub>2</sub> concentration, which were calculated from the daily mean values.

### Acknowledgments

The authors express their sincere gratitude to Drs. M. Fukabori, H. Murayama, S. Murayama, A. Shimizu and M. Hayashi for their operating our CO<sub>2</sub> measurement system. We also acknowledge to the members of the 25, 26, 27, 28, 29, 30, 31 and 32th Japanese Antarctic Research Expeditions for cooperating in this measurement. We are grateful to Profs. M. Tanaka and S. Kawaguchi for their special effort for starting and continuing this measurement in Syowa Station.
