1. Introduction

Svalbard consisting of several islands (Fig. 1) is an important and unique place for Arctic research (Aoki et al., 1997). The Japanese Ny-Ålesund Observatory, which is called "Rabben", was established in April 1991 at Ny-Ålesund, Svalbard. It is located at about 1.5 km north-west from the center of Ny-Ålesund. The latitude, longitude and altitude of the observatory are 78°55'N, 11°56'E and about 40 m, respectively. We developed an automatic system for meteorological data acquisition, because no permanent staff stayed at the observatory throughout the year to maintain instruments. Their sensors were installed nearby Rabben (Fig. 2). Ground based measurements of meteorological elements have been made continuously since August 16, 1992 at the observatory. Aoki et al. (1997) reported the data in 1992 and 1993. This data report shows the data from January 1994 to October 1995. We have no data from November to December 1995.

2. Instrumentation

The automatic system for meteorological data acquisition is composed of sensors and a data recording unit. Atmospheric pressure, temperature, humidity, global solar radiation, wind speed and wind direction were measured. The specifications of the sensors are shown in Table 1. A barometer was installed in a room of Rabben. Air temperature and humidity were measured by a platinum resistance

thermometer and a polymer capacitive sensor, respectively. The sensors were installed in a radiation shield mounted on a meteorological tower at a height of 1.5 m above the ground. The IRDAM anemometer was mounted atop the meteorological tower at a height of 8 m above the ground. The principal wind sensor is similar to a hot-wire anemometer. Therefore, the direct signal from the sensor is influenced by changes of atmospheric pressure and temperature. The sensor has its own computer, barometer and thermometer for correction of the signal. A cup anemometer made by Makino Applied Inst. Inc. was also mounted near the top of the meteorological tower at a height of 7.5 m as a backup. Wind speed data from the cup anemometer are listed in this volume with asterisks (*) when wind data from the IRDAM anemometer are not available. Global solar radiation is measured by a pyranometer mounted on the roof of Rabben. Analog output from the sensors is converted to digital data through a data logger. The digital data are averaged every 5 min and recorded on a floppy disk. In order to prevent confusion of change of local time, *i.e.* summer time and normal time, we decided to use universal time (UT) for the meteorological data. Hourly mean data, except for wind direction data, are shown in Table 2. Wind direction in Table 2 indicates the most frequent direction throughout the hour. Hourly mean data, except for wind direction data, are shown in Table 2. Wind direction in Table 2 indicates the most frequent direction throughout the hour. Daily mean data are shown in Table 3. The daily mean data are calculated by averaging the hourly mean data.

Acknowledgments

The authors would like to express their sincere thanks to the Norwegian Polar Research Institute members in Ny-Ålesund for maintaining our data collecting system. The authors also thank the Arctic Environment Research Center in the National Institute of Polar Research for the financial and logistics support. This work has been partially supported by the Ministry of Education, Science and Culture through Grant-in-Aid No.05044065.

Notation in Table 2

UT: Universal time

Pst: Pressure at the observatory height (hourly mean).

T: Air temperature (hourly mean).

U: Relative humidity (hourly mean).

GR: Global radiation (hourly mean).

WV: Wind speed (hourly mean).

WD: Wind direction (most frequent direction throughout the hour).

Notation in Table 3

YYMMDD: Date (year, month and date).

Pst: Pressure at the observatory height (daily mean).

T: Air temperature (daily mean).

U: Relative humidity (daily mean).

GR: Global radiation (daily mean)

WV: Wind speed (daily mean).

n: Using hourly mean data for calculation. "24" means normal mean.
