

Riometer Records of 30 MHz Cosmic Noise at Syowa Station, Antarctica from February 1967 to February 1968

Compiled by

Masami OSE and Ichizo NISHIMUTA

Observations of 30 MHz cosmic radio noise at Syowa Station, Antarctica have been carried out since February 1966. A standard riometer (relative ionospheric opacity meter) has been used for absorption in the ionosphere, *i.e.*, measurement of cosmic radio noise in regular emission.

This report has been prepared in order to make the data available to the ionospheric physicists. The records cover the period from February 8, 1967 to February 2, 1968 and are deposited in the Radio Research Laboratories. Enquiries about the contents of this report should be addressed to:

Radio Research Laboratories
Ministry of Postal Services
Kokubunji, P. O.
Tokyo
Japan

1. Location

Syowa Station			
Geographic		Geomagnetic	
Latitude	Longitude	Latitude	Longitude
69°00' S	39°35' E	69.6° S	77.1° E

2. Observers

Mr. Masami OSE (Radio Research Laboratories)

Mr. Ichizo NISHIMUTA (Radio Research Laboratories)

3. Method of measurement

Cosmic radio noise at 30 MHz was recorded at Syowa Station by a standard riometer, connected to a vertically-direct, five-element Yagi antenna. The antenna was designed to match the 50 ohm coaxial transmission line (HF cable).

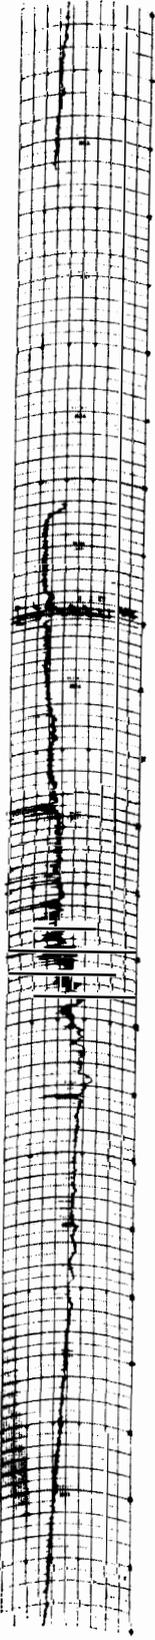

Syowa Station suffers very little interference and atmospheric noise and is favourable for measurement, but sometimes in the daytime it is troubled with man-made noises occurring within the station. The hours in this record are expressed as 45-degree East Meridian Time(45° E. M. T.) or U. T. + 3 hours. The riometer was operated well during the year and was ordinarily calibrated once a day.

4. Outline of results

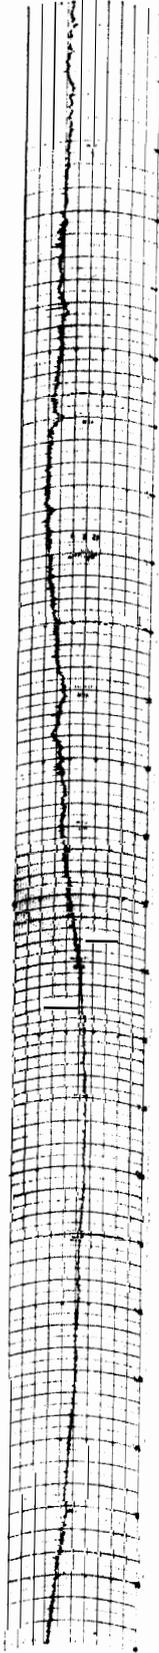

In December, January and February, the summer season in Antarctica, quiet days prevail comparatively, but from the latter part of March disturbed days begin to increase associated with PCA(polar cap absorption) and aurora, and until late in November quiet days are rather few. Generally speaking, in summer with many sunlit hours, radio disturbances associated with PCA and aurora seem to be less. The maximum and minimum values of the diurnal variation of quiet days, depending on the sidereal time, are reverse in summer to those in winter, and throughout the year the change gradually slips. In September and October the maximum values shift greatly. This may be attributed to the fact that the sunlit hours increase and summer sets in suddenly in Antarctica. During the period between April and October, Syowa Station suffered from blizzard about once a week. On each occasion of blizzard static noises were recorded, which caused amplification of the diurnal records of the riometer. Accordingly, a fairly good relationship between the amplitudes of diurnal variation and wind velocity will be estimated.
