

**Riometer Record of 30 MHz Cosmic Noise  
at Syowa Station, Antarctica in 1974**

**Ichiro YAMAZAKI and Isao SHIRO  
(Radio Research Laboratories, Koganei-shi, Tokyo)**

**1. Introduction**

Observations of 30 MHz cosmic radio noise with a standard riometer (relative ionospheric opacity meter) have been carried out at Syowa Station, Antarctica since February of 1966 by representatives from the Radio Research Laboratories.

This report has been prepared in order to make the data available to ionospheric physicists. The data records covering the period from January 1 to December 31, 1974 are deposited in the Radio Research Laboratories.

Inquiries about the contents of this report should be addressed to:

Radio Research Laboratories  
Ministry of Posts and Telecommunications  
2-1, Nukui-Kitamachi 4-chome, Koganei-shi,  
Tokyo 184, Japan

**2. Location**

Syowa Station			
Geographic		Geomagnetic	
Latitude	Longitude	Latitude	Longitude
60°00' S	39°35' E	69.6° S	77.1° E

**3. Observers**

In January, 1974

Ichizo NISHIMUTA (Radio Research Laboratories)  
Hisashi YABUUMA (Radio Research Laboratories)

From February to December, 1974

Ichiro YAMAZAKI (Radio Research Laboratories)

Isao SHIRO (Radio Research Laboratories)

#### 4. Method of measurement

The standard riometer, which is still in operation at Syowa Station, has a frequency of 30 MHz and a bandwidth of 3.5 kHz. It is connected to a vertically directed five-element Yagi antenna which is designed to match the 50 ohm coaxial transmission line (8D-2V) of 80 meters in length. The elements of the antenna are oriented in the east-west direction.

The noise power output is recorded by a pen recorder with a 1 mm/min paper speed, and noise power levels of 0, 1, 2, 3 and 4 dB (from a reference noise diode) are introduced into the receiver once a day for calibration.

#### 5. Remarks

The noise power measured by a riometer is not identical with the cosmic noise power itself because of ionospheric absorption. If the ionosphere is in a quiet state the diurnal variation of the cosmic noise power is easily extracted from the chart recordings. However, several complications can occur because of the seasonal, diurnal and abnormal short term variations in ionospheric absorption.

On account of the rotation of the earth, there is a difference between solar and sidereal time. Therefore the time (local time) when the same radio source passes the zenith gets earlier by about 4 minutes each day and returns to its initial state in a year.

Ionospheric absorption data obtained by means of the riometer method are given in the C.N.A. tables, where the cosmic noise absorption is defined by the deviation of the cosmic noise from its monthly reference level. The reference level is calculated from selected quiet diurnal variations in the month. The hourly values of the cosmic noise absorption are shown in dBm.
