Observational meteorological data at Dome Fuji (77°19'01"S, 39°42'12"S, 3810 m a.s.l.) in 1995-1997, 2003 and reanalyse data (ERA-Interim by ECM-WF and JRA55 by JMA) were compared. We found that correlation coefficients between observational air temperature and ERA-Interim ranges 0.73 to 0.95 for four years’ monthly average (1995, 96, 97 and 2003), and 0.40 to 0.82 for JRA 55. Thus, we estimated the air temperature at Dome Fuji from 1998 to 2002, and from 2004 to 2017 by using the relation between observational results and ERA-Interim. Figure 1 shows temperature variation at Dome Fuji from January 1, 1995 to December 31, 2017.

We will talk about other meteorological elements (atmospheric pressure, wind speed and wind direction) at Dome Fuji for 1995 to 2017.

Fig. 1 Reconstructed air temperature at Dome Fuji using in-situ observational data and reanalyses data of ERA-Interim. Reanalyses data of ERA-Interim (1998 to 2002, 2004 to 2017) are corrected using in-situ observational data.
