

**Biogeochemical properties of seawater measured from the icebreaker *Shirase*
during the 54th Japanese Antarctic Research Expedition
in the austral summer, 2012–2013**

1. Introduction

Biogeochemical properties of seawater have been routinely measured between Japan and the Japanese Antarctic Station Syowa (69°00'S, 39°35'E) as part of the monitoring program of the Japanese Antarctic Research Expedition (JARE), which is conducted each austral summer season (December–March) along regular routes across the Indian Ocean sector of the Southern Ocean. During JARE cruises, data have been collected both in the open ocean, and, since the 52nd JARE (2010–2011), in areas of sea ice off Syowa Station, Lützow-Holm Bay.

This report presents biogeochemical data acquired from the JARE-54 cruise (2012–2013). The dataset is composed of two series of data: (1) vertical profile data sampled at routine monitoring stations along a meridional transect at 110°E, 150°E, and data collected in Lützow-Holm Bay; and (2) surface water samples obtained along cruise tracks to confirm spatial variations in biogeochemical properties.

2. Sampling

Biogeochemical data presented in this report include temperature and salinity (measured by a sensor probe) and inorganic nutrients and chlorophyll *a* concentrations (measured by water analysis). All seawater samples and auxiliary data were taken from the icebreaker *Shirase* during the JARE-54 cruise. The sampling stations are shown in [Figure 1](#).

2.1. Vertical profile sampling

Seawater samples and auxiliary data for vertical profiles were taken at monitoring stations along 110°E (L1–L5), 150°E (L6–L10), and in Lützow-Holm Bay ([A–BP](#)) in December 2012, March 2013, and February 2013, respectively. Sampling at station L7 (60°S, 150°E) was canceled because of rough seas, and sampling at station D (planned in the pack ice zone) was canceled due to an extremely narrow pack ice zone. At the time of sampling, station A was located in the multi-year fast-ice zone, and station B was located in the first-year fast-ice zone. Station C was located in the open ocean zone, although it was adjacent to the pack ice zone ([Fig. 1](#)). Details of sampling in the sea-ice area are given in Takahashi *et al.* (2012, 2014).

Vertical temperature and salinity profiles were measured to a depth of 500 m using a conductivity–temperature–depth (CTD) memory probe (SBE 19 plus; Sea-Bird Electronics, Inc.) attached to a water sampler (SBE 55 ECO; Sea-Bird Electronics, Inc.). The data were downloaded from the CTD to a laptop computer immediately after each cast. The CTD sensor was calibrated by the manufacturer prior to the cruise. Note that the salinity data in this report were not corrected by the bottle salinity data measured by the salinometer.

Seawater was sampled to a depth of 400 m or to the bottom depth (whichever was less) during the down cast using a standard 4 L Niskin bottle (Sea-Bird Electronics, Inc.). Sampling was conducted at depths of 20, 50, 75, 100, 200, and 400 m at stations L1–L10 and C–BP, at 20, 50, 75, 100, 200, and 240 m at station A, and at 5, 20, 50, 75, 100, and 200 m at station B. Seawater at 0 m was collected from the deck using a 5 L polyethylene bucket. Seawater samples at 400 m at station L1 and at 200 m at station L2 were unavailable because of sampling difficulties. Seawater samples

other than 0 and 75 m at station A were also unavailable because of Niskin bottle sample difficulties caused by seawater temperatures which were near the freezing point.

Seawater was subsampled into 10 mL polyethylene screw-cap vials and 250 mL high density polyethylene (HDPE) screw-cap light blocking bottles to analyze concentrations of inorganic nutrients and chlorophyll *a*, respectively. After subsampling, seawater samples for nutrient analysis were immediately placed and stored in an ultra-low temperature freezer (-85°C) until analysis on land. Phytoplankton chlorophyll *a* was extracted by N, N-Dimethylformamide (Suzuki and Ishimaru, 1990) just after filtering the seawater using a glass fiber filter (Whatman, GF/F), and the samples were stored in a freezer (-18°C) until analysis on board.

2.2. Underway sampling

Underway surface water sampling was conducted during the cruise. Seawater was continuously pumped from 10 m below sea level to an on-board laboratory, and the inlet seawater temperature and salinity were quasi-continuously measured by sensor probes (SBE 38 for temperature and SBE45 for salinity; Sea-Bird Electronics, Inc.). Inorganic nutrients and chlorophyll *a* were analyzed from samples collected manually 2–3 times per day from the outlet of the laboratory; samples were treated in the same manner as those of the bottle samples collected in the vertical profiles.

3. Analysis

Concentrations of chlorophyll *a* were determined fluorometrically (Parsons *et al.*, 1984) using an on-board fluorometer (10-AU; Turner Design, Sunnyvale). The fluorometer was calibrated against a chlorophyll *a* standard (Wako Chemical Co.) at a laboratory on land prior to the cruise, using a spectrophotometer and the specific absorption coefficient (Porra *et al.*, 1989).

The samples for the nutrient concentration analyses were frozen and transported to a laboratory at Hokkaido University, Japan, via the National Institute of Polar Research, Japan. The frozen samples were thawed to room temperature starting the day before the analyses. Concentrations of the nutrients $\text{NO}_3 + \text{NO}_2$, PO_4 , SiO_2 , NH_4 , and NO_2 were determined using an autoanalyzer

(QuAAstro2-HR; BL-TEC K. K.), according to the Joint Global Ocean Flux Study colorimetric analysis method (JGOFS, 1994). The nutrient concentrations were calibrated against KANSO reference materials (BT, BF, BG, BS, and AZ; KANSO Technos Co., Ltd.) except for NH₄, which was calibrated using an ammonium nitrogen standard solution for water analysis (Wako Pure Chemical Industries, Ltd.).

4. Results

All information about sampling at the routine monitoring stations is listed in [Table 1](#). Vertical profiles of temperature and salinity at each monitoring station are shown in [Figure 2](#), and bottle analysis data, along with CTD data at defined depths, are listed in [Table 2](#). Underway water sampling analysis data and sampling information are shown in [Table 3](#).

5. Data archive

The data presented in this report are archived and available as csv file from web site (<http://biows.nipr.ac.jp/JARE/>). Permission to use these data for publication of presentation should be obtained in writing. Inquiries about details of the data record should be addressed to:

Takahiro Iida

National Institute of Polar Research

E-mail: iida@nipr.ac.jp

Acknowledgments

We express our heartfelt appreciation to all members of JARE-54 for their support. We also thank the officers and crew of the icebreaker *Shirase*. We thank Ms. A. Murayama (Hokkaido Univ.) for her kind cooperation in analyzing the nutrient samples.
