HIROSHI SASAKI

(Faculty of Agriculture, Tohoku University, Sendai 980)

and

Mitsuo FUKUCHI

(National Institute of Polar Research, Itabashi-ku, Tokyo 173)

During every austral summer season, plankton samplings on board the icebreaker Fuji have been carried out in the Indian sector of the Antarctic Ocean as part of the marine biological program of the Japanese Antarctic Research Expedition (JARE). Details of sampling method and the results of earlier works in 1972-1980 are published elsewhere (Fukuchi and Tanimura, 1981). Since then, three expeditions of JARE-22, -23 and -24 (1980-1983) completed their plankton samplings. The data record of these results is presented in this report.

The first and second authors (K. W. and Y. N.) carried out the plankton samplings in JARE-22 (1980/1981), the third author (Y. I.) made the JARE-23's samplings (1981/1982) and the fourth author (H. S.) made the JARE-24's samplings (1982/1983). A single Norpac standard net had been used in the earlier expeditions but a twin net was employed in JARE-23 and -24. The twin net consisted of two Norpac standard nets of two different mesh openings as listed in the following tables.

Stations of plankton samplings in 1980-1983 are shown in Fig. 1. Data on the Norpac net hauls in JARE-22, -23 and -24 are listed in Tables 1, 2 and 3, respectively. Also, data on the MTD net tows, the ORI-C net tows and the fish larva net tows in JARE-22 are summarized in Tables 4, 5 and 6, respectively.

Although measurements of biomass and primary sorting of these net samples are being undertaken, this report is prepared for the sake of making available to interested persons some preliminary data on plankton samples stored at the National Institute of Polar Research. Inquiries about details of the data record should be addressed to:

Department of Biological Data

Division of Data Collection and Processing

National Institute of Polar Research

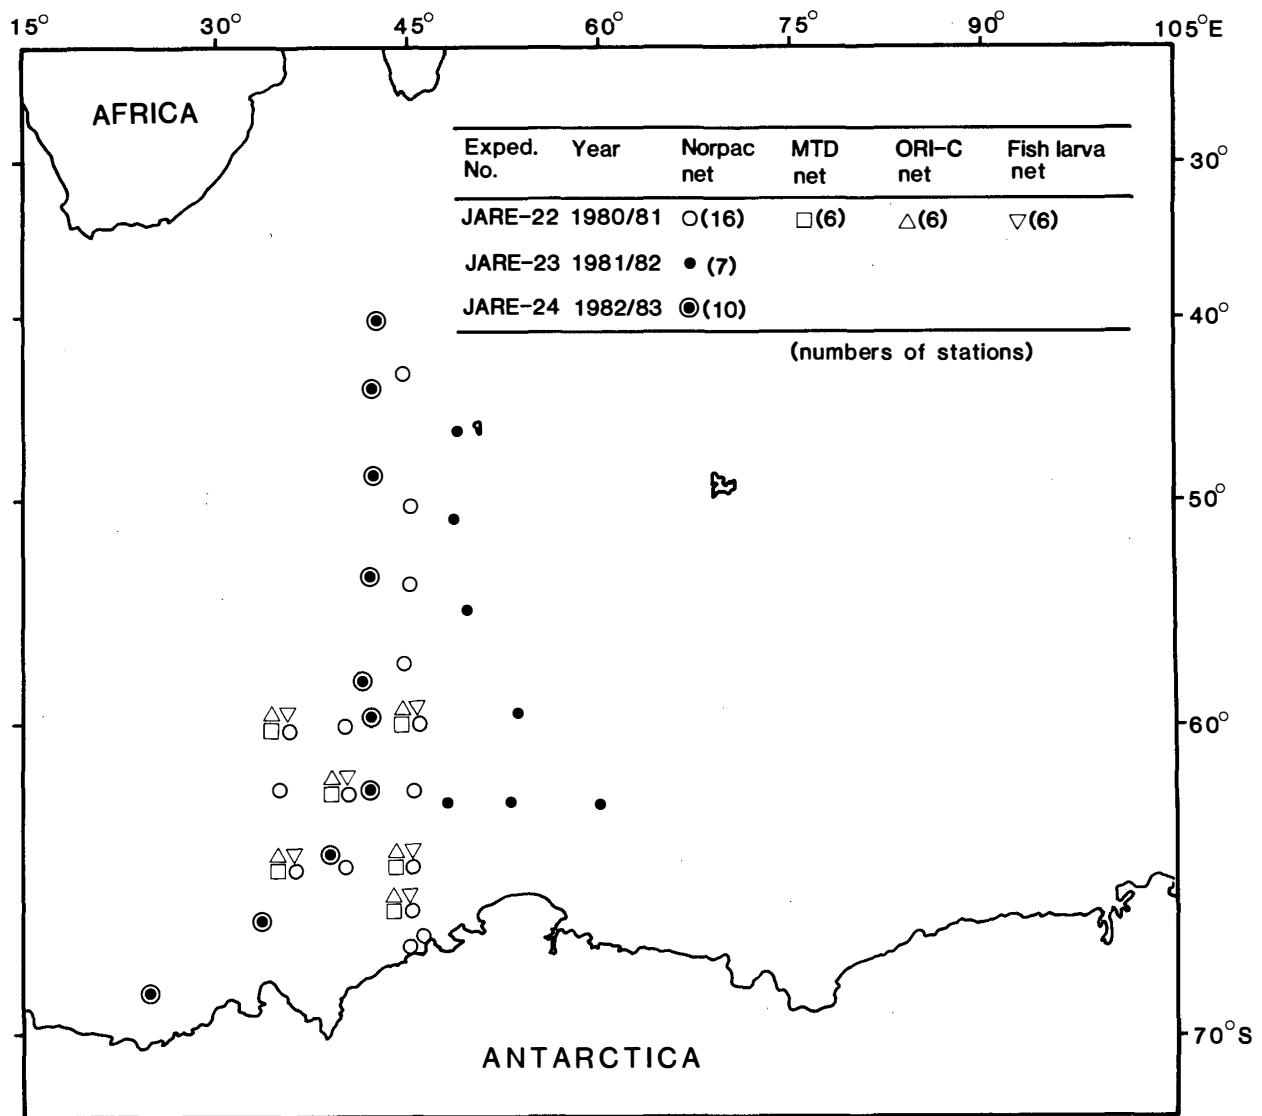

Fig.1. Stations of plankton net samplings on board the icebreaker Fuji in the Indian sector of the Antarctic Ocean in 1980-1983.

Table 1. Data on plankton collected by vertical hauls with a Norpac standard net (0.33 mm mesh openings) in the JARE-22 cruise of the Fuji to the Indian sector of the Antarctic Ocean, Feb. - Mar. 1981. Flow-meter was not used. The volume of water filtered by a vertical haul was estimated by assuming 100 % efficiency of the net. Samplings were carried out by K. Watanabe and Y. Nakajima.

Table 4. Data on plankton collected by simultaneous horizontal tows with MTD horizontal closing nets (0.35 mm mesh openings) in the JARE-22 cruise of the Fuji to the Indian sector of the Antarctic Ocean, Feb. 1981. The volume of water filtered by a 30 min horizontal tow is calculated to be 456 m³ when filtration efficiency of the net is 100 %. Samplings were carried out by K. Watanabe and Y. Nakajima
