

Oceanographic Data of the 28th Japanese
Antarctic Research Expedition
from November 1986 to April 1987

Yutaka MICHIDA and Shinobu INAZUMI
Hydrographic Department, Maritime Safety Agency
3-1, Tsukiji 5-chome, Chuo-ku, Tokyo 104

The results of the oceanographic observations on board icebreaker Shirase and tidal observation at Syowa Station are presented in this report. The oceanographic observations were carried out in the summer mission of the 28th Japanese Antarctic Research Expedition (JARE-28) in 1986-1987. Tidal observation was continued through the winter mission of JARE-27 in 1985-1986.

1. Oceanographic Observations

The track chart of icebreaker Shirase and the station location of oceanographic observations are shown in Figs. 1 and 2. Surface water sampling, and XBT, CTD and serial observations were made during the cruise. One surface drifting buoy was deployed in the area of the Antarctic circumpolar current.

(1) Surface water sampling

Surface temperature measurement and surface water sampling for chemical analysis were made twice or three times a day (once a day when Shirase stayed in ice-covered area). The results are given in Table 1.

(2) XBT observation

XBT (expendable bathythermograph) observations were carried out in the Southern Ocean en route from Fremantle to

Mauritius. The results are given in Table 2.

(3) CTD observation

CTD (conductivity, temperature and depth profiling system of Neil Brown Smart CTD type-c) observations were carried out in the Southern Ocean en route from the ice edge to Mauritius. The results are given in Table 3.

(4) Serial observation

Serial observations were carried out at 13 stations. The results including interpolated and calculated values of temperature, practical salinity, sigma-t and dynamic depth anomaly at each standard depth are given in Table 4, together with meteorological data.

(5) Chemical analysis of sampled water

The following methods and instruments were used in chemical analysis:

Practical salinity: Inductive salinometer (Auto-lab Model 601 MK-III)

pH : Digital pH meter (Denki Kagaku Keiki Co. HG-3)

Dissolved oxygen : The Winkler's method with a Metrohm Model E415-20S titrator.

Phosphate-P* : Molybdenum blue method

Silicate-Si* : Molybdenum yellow method

Nitrate-N* : Modified Morris and Riley method

Nitrite-N* : Sulphanilamide and N-(l-naphtyl)ethylene-diamine dihydrochloride were used as reagent.

Ammonium-N* : Indophenol method

Petroleum oil : Integrated Ocean Service System method

Cd,Hg,Cu and Zn : Japan Hydrographic Department method

(* The nutrient matters were analyzed with a Shimadzu Model UV-210A spectrophotometer with auto flow cell system.)

The results of analysis on petroleum oil, Cd, Hg, Cu and Zn concentrations are given in Table 5.

(6) Current observation with a surface drifting buoy

One surface drifting buoy was deployed at 47° 35'S, 47° 10'E on March 7, 1987. It had drifted northward in the early stage, then eastward and had been in operation till June 1987. The trajectory is shown in Fig. 3 and the location data are given in Table 6.

2. Tidal Observation

The tidal observation at Syowa Station has been carried out since 1965. At present, a pressure gauge (strain gauge) is operated. The sensor is placed in the Nisi-no-ura Cove on East Ongul Island at a depth of about 15 m below the sea surface, and the recorder is installed in the Earth Science Laboratory. Hourly, daily and monthly mean sea levels from February 1986 to January 1987 are given in Table 7.

New tide gauge (Meisei Denki Co. QWP-8-103D) was set on January 14, 1987 and has been operated since then.

Acknowledgments

The authors would like to express their sincere thanks to Prof. T. Hoshiai, the leader of JARE-28, and all the members of the expedition for their helpful support and valuable advices, and to Mr. K. Uchida and the other members of JARE-27 for their cooperation in maintenance and calibration of the tide gauge. The authors also express their thanks to Captain A. Kurata, the officers and the crew of icebreaker Shirase.
