

Oceanographic Data in Lützow-Holm Bay of the Antarctic Climate Research Program
from January 1991 to February 1992 (JARE-32)

Kay I. OHSHIMA and Toshiyuki KAWAMURA

The Institute of Low Temperature Science, Hokkaido University,
Kita-19, Nishi-8, Kita-ku, Sapporo 060

From 1989 to 1992, under the Japanese Antarctic Climate Research (ACR) program, extensive observations of ocean and sea ice have been carried out in and off Lützow-Holm Bay by JARE-31 and -32 for better understanding of the annual cycle of the ocean and sea ice processes. In this report, we present oceanographic data including CTD, XBT, AXBT, dissolved oxygen and vertical current profiles, from January 1991 to February 1992, during JARE-32. In addition to these observations, we also carried out measurements of physical and chemical properties of sea ice, long-term moored measurements with current meters and thermistor strings, and meteorological observations with Argos buoys. These results will be reported in other volumes.

Snow vehicles and sledges equipped with the winch were used for expeditions of observations on the fast ice. The observational stations are almost in the same positions as those of JARE-31. The stations were selected in four areas: Ongul Strait, Hovdebukta (Hovde Bay), the eastern half of Lützow-Holm Bay and around a selected iceberg. Locations of the stations are shown in Figs. 1, 2 and 3. In Ongul Strait the observations were made almost monthly, in Hovdebukta only in May and November, in the eastern half of the bay in three periods: April, August and October–November.

At each station, we measured water temperature and salinity profiles using a conductivity–temperature–depth profiling system (CTD, model SBE-19, Sea-Bird Electronics Inc., USA). The CTD data at standard depths are shown in Table 1. The raw CTD data (vertical resolution is better than 1 m) are written on floppy disks as text files, and are available for any scientific purpose. At some stations, XBT observations were taken instead of CTD observations. The

XBT data are shown in Table 2.

Water samples were collected with Nansen bottles. To determine the amount of dissolved oxygen in the sea-water samples, we used Winkler's method with a titrator (model E645/E552, Metrohm, Switzerland). The dissolved oxygen data are shown in Table 3.

Vertical current profiles were measured with an electromagnetic current meter (model ACM8M, ALEC Electronics Co., Japan). The currents were usually measured at every 20 m depth from the sea surface. The current meter data are shown in Table 4.

In the open water area or coastal flaw polynya off Lützow-Holm Bay, aircraft-deployed expendable bathythermograph (AXBT, Tsurumi Seiki Co., Japan) observations were carried out from a Cessna plane, nearly monthly except in mid-winter. Positions of the AXBT casts are shown in Fig. 4. The positions are determined by the flight information, thus are not so accurate. The AXBTs gave us water temperature profiles down to 460 m in depth as analogue data. Temperature accuracy of the AXBT is $\pm 0.1^{\circ}\text{C}$. The temperature data at ten meters intervals are shown in Table 5.

We are much indebted to Prof. Y. Fujii, leader of the wintering party of JARE-32, and to all the members of JARE-32 for their cooperation in the field work on ice and the flight operation. Support from JARE-31 and -33 is also appreciated. Thanks are extended to Prof. Emeritus S. Kawaguchi, Profs. N. Ono, T. Yamanouchi and M. Wakatsuchi for their support and encouragement. Thanks are also due to Ms. F. Sugawara for her support in preparation of the tables.
