1. Introduction

This is a report on the limnological parameters which were continuously recorded by means of mooring data-logger arrays in two Skarvsnes lakes, Oyako Ike and Naga Ike (Fig. 1) during the 50th and 51st Japanese Antarctic Research Expeditions (JARE) in 2009–2010. This study was one of our “Long-term monitoring studies on Antarctic terrestrial ecosystem” which were started in 2006, under the umbrella of the VII term of Antarctic research expedition plans. Water temperature, photosynthetically active radiation (PAR), chlorophyll fluorescence and turbidity in lakes were measured and recorded automatically at intervals of 60 min. Trials of similar continuous observation of limnological parameters in shallow lakes using prototype mooring arrays have been reported by Kudoh et al. (2003), and Tanabe *et al.* (2008).

2. Materials and Methods

Design of the mooring array: The mooring array consisted of temperature loggers (NWT, Nichiyu Giken Kogyo), PAR loggers (ALW-CMP, JFE Advantech) and chlorophyll-turbidity loggers (ACLW-CMP, JFE Advantech). These were attached at given depths of a rope which was connected to a plastic float and a sinker on both sides, as shown in Fig. 2. The array was moored at the lake center where the nearly-maximum depth was detected. Exact depths at the mooring sites were 7.5 m and 10.0 m in Oyako Ike and Naga Ike, respectively. The positions measured by a portable GPS (GPSMAP 60CSx, Garmin) were 69°28.514'S, 39°36.154'E and 69°29.240'S, 39°35.854'E in Lake Oyako Ike and L. Naga Ike, respectively.

Settings of the data loggers: Temperature data were sampled every 60 minutes from 0:00 (local

time) on 1 January 2009 to 11:00 on 13 January 2010 in Oyako Ike, and from 0:00 on 1 January 2009 to 15:00 on 22 January 2010 in Naga Ike. PAR data were recorded at 60 minute intervals, and the chlorophyll fluorescence and turbidity data were recorded at 60 minute intervals during the same periods of the temperature loggers in both lakes. All loggers were pre- and post-calibrated by the manufacturers, who found no significant drifts in the measurements over the course of the study. Units of recorded data were °C and $\mu\text{mol}/\text{m}^2/\text{s}$ for temperature and PAR, respectively. Fluorescence from chlorophyll α was recorded as relative intensity against fluorescein sodium (Uranine) concentration, and turbidity was recorded as Formazin Nephelometric Units (FTU).

3. Data

Temperature data collected at three different depths in Oyako Ike are illustrated in Fig. 3, and the monthly summarized data are listed in Tables 1-1 to 1-13. From the beginning of January to the end of March in 2009, and from the end of September to the end of the present observation in 2010, temperature at two different upper depths took almost the same values, the three lines in Fig. 3 during these periods overlapped. Temperature data at six different depths of Naga Ike are illustrated in Fig. 4, and listed in Tables 2-1 to 2-13. Temperatures at four separate deeper depths took almost the same values from the beginning of January to the middle of March in 2009, and from the middle of November in 2009 to the end of the present observation in 2010. PAR data at 6.1 m depth in Oyako Ike are illustrated in Fig. 5, and the monthly summarized data are listed in Tables 3-1 to 3-12. PAR at 1.5 m depths in Naga Ike are illustrated in Fig. 6, and the monthly summarized data are listed in Tables 4-1 to 4-12. Chlorophyll fluorescence and turbidity data in Oyako Ike are illustrated in Fig. 7, and the monthly summarized data are listed in Tables 5-1 to 5-12. Those for Naga Ike data are in Fig. 8 and Tables 6-1 to 6-12. Extra-ordinary high values and low values of chlorophyll fluorescence and turbidity data were recorded from the beginning of June to the end of December and during the whole observation period, respectively, in Oyako Ike. In Naga Ike, such extra-ordinary values of chlorophyll fluorescence and turbidity were also recorded from the end of August to mid-November and the beginning of September to the end of December 2009, respectively. These invalid values were omitted from the summarized process and are not listed in Tables 5 and 6, nor are they illustrated in Figs 7 and 8. Temperature data at 1.0 m depth in Naga Ike recorded sub-zero values from 8 May 2009 to mid-June 2010. A few values which exceeded the measurement limits were omitted and are not listed in the Table. Possible reasons for such high fluorescence and turbidity were that, firstly, some photobenthos mats lifted-off and floated in the water column, and those might have attached to the wiper of the chlorophyll-turbidity logger for a while. Lift-off mat assemblages are commonly recognized feature in Skarvsnes lakes and also in Antarctic lakes even in ice-covered seasons (Quesada *et al.*, 2008). Secondly, the loggers might be incorporated into the developed ice cover on the lake surface.

4. Scientists who carried out the field study

Installation of the mooring arrays was carried out by Yukiko Tanabe and Sakae Kudoh (the 49th JARE members) and the retrieval of the arrays was carried out by Yukiko Tanabe, Takashi Osono, Masaki Uchida, and Sakae Kudoh (the 51st JARE members).

5. Data policy

Before using the data for publication or presentation in any media, please request permission in writing. Inquiries should be addressed to:

Yukiko TANABE, JSPS Research Fellow
