## 1. Introduction

In order to clarify the distribution and variation of the sources and sinks of atmospheric CO<sub>2</sub> and to predict future levels of the CO<sub>2</sub> concentration quantitatively, precise observations of the atmospheric CO<sub>2</sub> concentration have been required for many years. For this purpose, systematic measurements of the CO<sub>2</sub> concentration have been extended to many ground-fixed stations around the world, either by continuous sampling with an *in-situ* analyzer or by discrete flask sampling with subsequent laboratory analysis. *In-situ* continuous CO<sub>2</sub> measurements at Syowa Station started in February 1984 have been continued to the present. We have already shown that Syowa Station is a suitable site for monitoring background values of the atmospheric CO<sub>2</sub> concentration, because there are no local or regional effects due to land vegetation and industrial activity around Antarctica (Tanaka *et al.*, 1987; Nakazawa *et al.*, 1991; Aoki and Nakazawa, 1997; Murayama *et al.*, 1997). The CO<sub>2</sub> data obtained before February 1992 have already been published as a series of this data report (Aoki *et al.*, 2000). In this report, we will show the daily and monthly averaged values of the CO<sub>2</sub> concentration observed for the period from February 1992 to January 2001.

## 2. Instrumentation

Since detailed descriptions of our continuous measurement systems have been given elsewhere (Tanaka *et al.*, 1987; Nakazawa *et al.*, 1991; Morimoto *et al.*, 2003), only a brief description will be given here.

We have used two measurement systems at Syowa Station so far. The first system was installed in 1984. It consisted of a non-dispersive infrared analyzer (NDIR; Horiba VIA-500R) and a gas handling system. Air intake was mounted at the top of an 8 m-high mast at the coastline of Syowa Station (Fig. 1), facing toward the prevailing winds. Air samples were introduced into the continuous measurement system by pumping through copper and stainless steel tubes from the air intake. Water vapor and aerosol particles were removed from the air sample by a cold trap at  $-60^{\circ}\text{C}$  and  $1\ \mu\text{m}$  membrane filters, respectively. Three kinds of working standard gases, high, middle and low  $\text{CO}_2$  concentration gases, were prepared for continuous measurement; the high and low gases were analyzed every 30 minutes to calibrate the NDIR analyzer and the middle gas every 10 days to examine the non-linear response of the analyzer. New standard gases were shipped to Syowa Station every year to replace the old ones. The  $\text{CO}_2$  concentrations of the standard gases were determined 4 times and once before and after their usage, respectively, with a precision of 0.01 ppmv by using our secondary standard gas system. Concentration drifts of the working standards during the usage were confirmed to be within 0.1 ppmv.

The second measurement system has been used at Syowa Station since February 1995. The fundamental structure and performance of the new system are similar to the old one, but a new type of NDIR (Horiba VIA-510R) is employed. The continuity of our  $\text{CO}_2$  measurements was examined by operating the two systems simultaneously at Syowa Station for 61 days in 1995. It was confirmed that the difference between the daily mean  $\text{CO}_2$  concentrations obtained by the two systems never exceeded 0.1 ppmv.

Therefore, the overall precision of continuous measurement of the  $\text{CO}_2$  concentration at Syowa Station is within 0.1 ppmv.

### **3. Data**

Eight data and six data per hour were obtained by the continuous measurement systems before January 1995 and after February 1995, respectively, so that a total of 512419 data were recorded from February 1992 to January 2001. To eliminate locally contaminated data, which presumably originated from station activities, we applied a simple statistical data selection scheme to the raw data set. We first calculated hourly mean values from the individual concentration data for each day. Provisional daily

means were calculated using the hourly means of which the standard deviations were less than 0.1 ppmv. Then, we rejected the raw data deviating by more than 0.3 ppmv from the daily means and calculated the hourly and daily means again. This data selection scheme was applied to the raw data set, so that 24312 data, 4.7% of all data, were rejected as outliers.

Figure 2 shows the daily mean CO<sub>2</sub> concentrations from 1984 to 2001. Table 1 shows the daily mean CO<sub>2</sub> concentrations, numbers of selected and total data and standard deviations of the daily mean values. Table 2 shows monthly mean values and standard deviations of the CO<sub>2</sub> concentration, which were calculated from the daily mean values.

### **Acknowledgments**

The authors express their sincere gratitude to Drs. K. Iwai, I. Nagao, M. Koide, H. Ui, Y. Esaki, T. Sakuraba and H. Shiba for operating our CO<sub>2</sub> measurement system. We also acknowledge the members of the 33, 34, 35, 36, 37, 38, 39, 40 and 41st Japanese Antarctic Research Expeditions for cooperating in these measurements and to the members of the Japan Meteorological Agency for their helpful assistance at Syowa Station since JARE-38. We are grateful to Dr. M. Shiobara for his special effort for starting this measurement at Syowa Station.
