

Riometer Records of 30 MHz Cosmic Noise
at Syowa Station, Antarctica
in 1970

Isao SHIRO and Toshiro SAKAMOTO

(Radio Research Laboratories, Koganei-shi, Tokyo)

1. Introduction

The observation of 30 MHz cosmic radio noise with a standard riometer (relative ionospheric opacity meter) has been carried out at Syowa Station, Antarctica since February 1966 by representatives from the Radio Research Laboratories.

This report has been prepared in order to make the data available to ionospheric physicists. The records covering the period from January 1 to December 31, 1970 are deposited at the Radio Research Laboratories.

Inquiries about the contents of this report should be addressed to :

Radio Research Laboratories

Ministry of Posts and Telecommunications

2-1, Nukui-Kitamachi 4-chome, Koganei-shi

Tokyo 184, Japan

2. Location

Syowa Station			
Geographic		Geomagnetic	
Latitude	Longitude	Latitude	Longitude
69° 00'S	39° 35'E	69.6° S	77.1° E

3. Observers

January 1970

Yasusada OTA (Radio Research Laboratories)

February to December 1970

Isao SHIRO (Radio Research Laboratories)

Toshiro SAKAMOTO (Radio Research Laboratories)

4. Method of measurement

The standard riometer at 30 MHz with 3.5 kHz bandwidth is connected to a vertically directed five-element Yagi antenna, which is designed to match the 50 ohm coaxial transmission line.

The noise power output is recorded with a pen recorder of 1mm/min paper speed, and the standard noise with power of 0, 1, 2, 3 and 4 dB levels is introduced into the receiver once a day as the calibration.

The time indicated on this record is the meridian time at 45°E in longitude (U.T. + 3 hours).

5. Remarks

The power observed in riometer is not identical with the cosmic noise power itself, but it should be taken into account of ionospheric absorption effects.

If the ionosphere is in a quiet state, the diurnal variation of the cosmic noise power is easily reduced. However, several complicated variations take place because of seasonal and diurnal variations and short-time abnormal absorptions in the ionosphere.

On account of movement of the earth, the time (local time) when the same radio source passed the zenith gets earlier by about 4 minutes day after day and is restored to the original state in a year because of the difference between solar and sidereal times.

In Fig.1 shows the monthly range of time of the maximum value (in solid lines) of diurnal variation of cosmic noise power on quiet days, and the time of the minimum value (in broken lines). The range is mainly due to the time difference mentioned above.

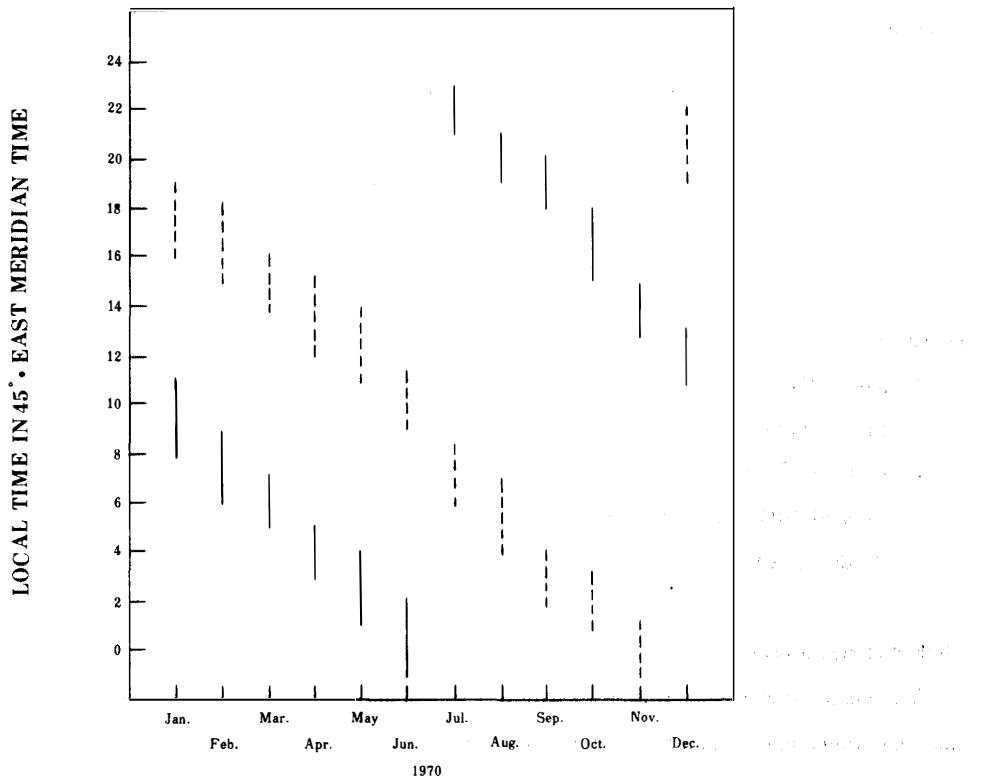

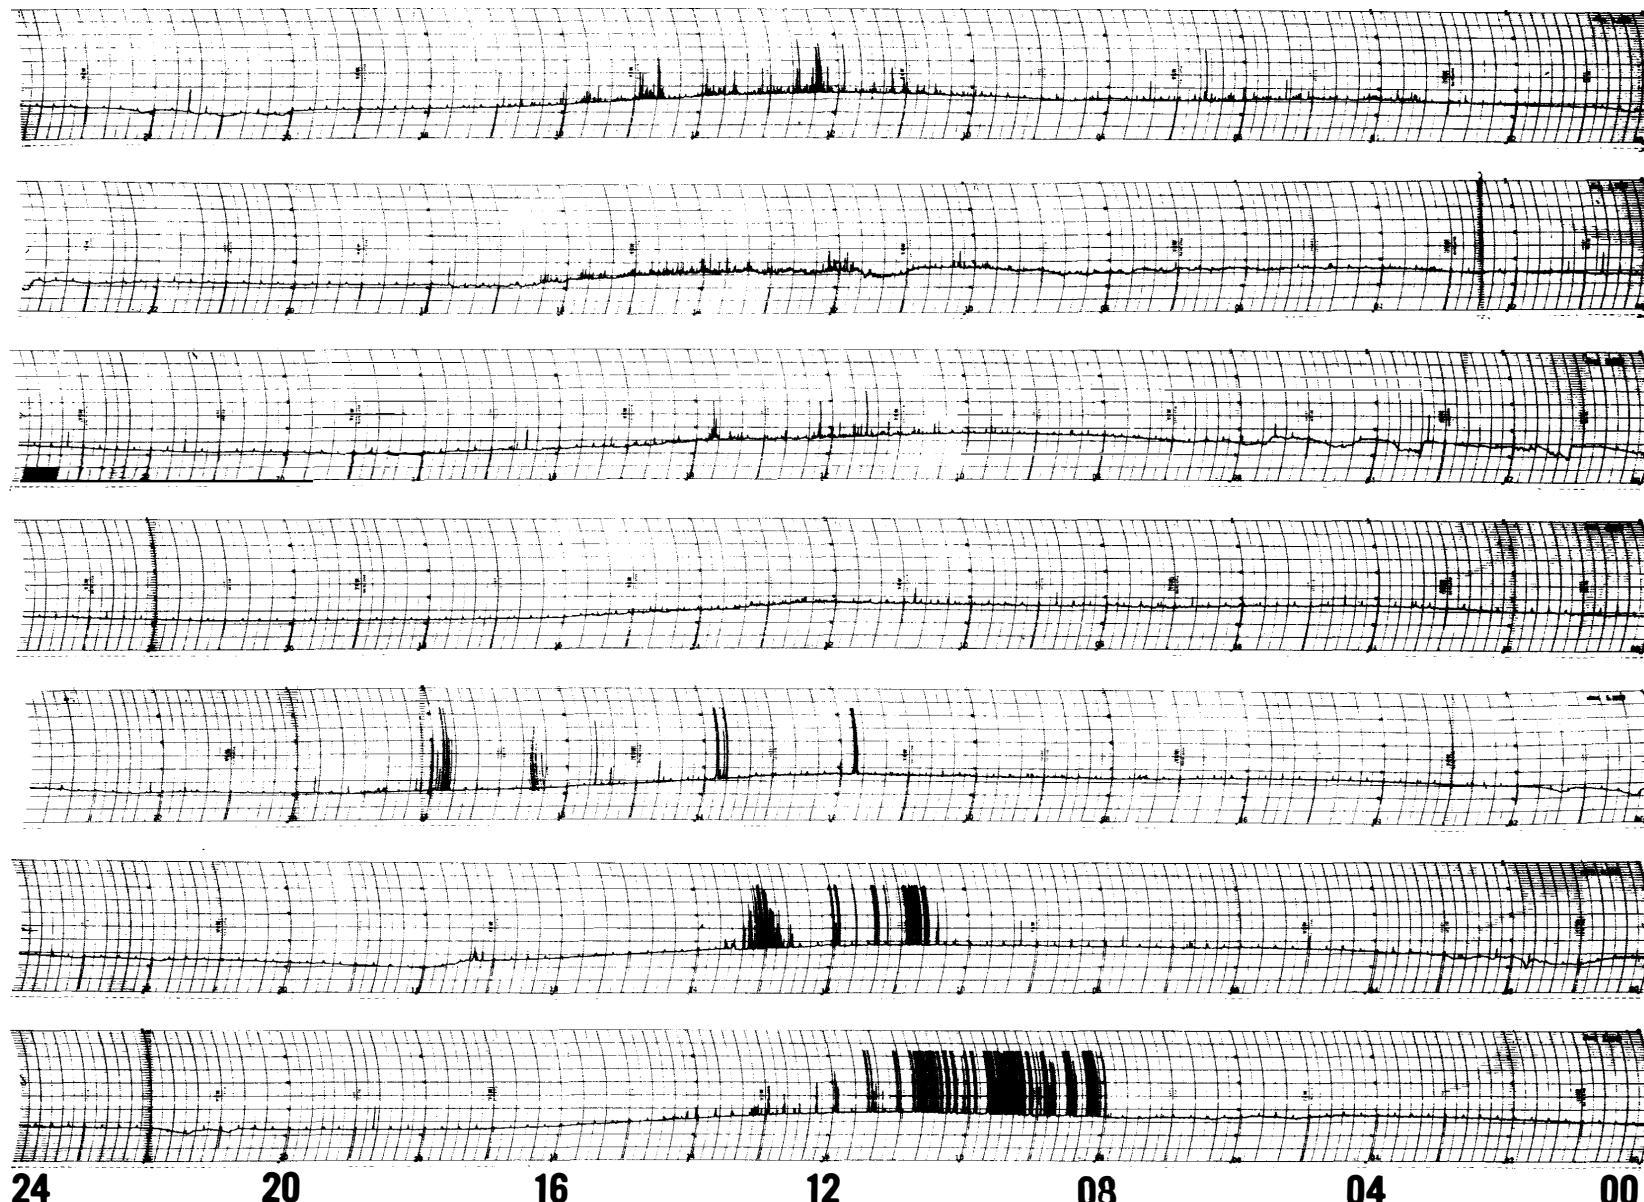

Fig. 1. Monthly range of the maximum values (—) and the minimum values (----) of cosmic noise power at Syowa Station.
