

RIOMETER RECORDS OF 30 MHz COSMIC NOISE
AT SYOWA STATION, ANTARCTICA IN 1976

Masami OSE, Akihisa YAMAKOSHI and Tsutomu SASAKI

(Radio Research Laboratories, Koganei-shi, Tokyo)

1. Introduction

Observations of cosmic radio noise with the standard riometer (relative ionospheric opacity meter) at 30 MHz have been carried out at Syowa Station, Antarctica, since February of 1966 by members from the Radio Research Laboratories.

This report has been prepared in order to make the data available to ionosphere physicists. The data records covering the period from January 1 to December 31, 1976 are deposited in the Radio Research Laboratories.

Inquiries about the contents of this report should be addressed to:

Radio Research Laboratories
Ministry of Posts and Telecommunications
2-1, Nukui-Kitamachi 4-chome, Koganei-shi
Tokyo 184, Japan

2. Location

Syowa Station			
Geographic		Geomagnetic	
Latitude	Longitude	Latitude	Longitude
69°00'S	39°35'E	69.6°S	77.1°E

3. Observers

Akihisa YAMAKOSHI (Radio Research Laboratories)

Tsutomu SASAKI (Radio Research Laboratories)

4. Method of Measurement

The standard riometer, which is still in operation at Syowa Station, has a frequency of 30 MHz and a bandwidth of 3.5 kHz. It is connected to a vertically directed five-element Yagi antenna which is designed to match the 50 ohm coaxial transmission line(8D-2V) of 80 meters in length. The elements of the antenna are oriented in the east-west direction.

The noise power output is recorded by a strip chart recorder with a 1 mm/min chart speed, and noise power levels of 0, 1, 2, 3 and 4 dB (from a reference noise diode) are introduced into the receiver once a day for calibration.

5. Remarks

The noise power measured by a riometer is not identical with the cosmic noise power itself because of ionospheric absorption. If the ionosphere is in a quiet state the diurnal variation of the cosmic noise power is easily extracted from the chart recordings. However, several complications can occur because of the seasonal, diurnal and abnormal short-term variations in ionospheric absorption.

On account of the rotation of the earth, there is a difference between solar and sidereal time. Therefore the time(local time) when the same radio source passes the zenith gets earlier by about 4 minutes each day and returns to its initial state in a year.

Ionospheric absorption data obtained by means of the riometer method are given in the C.N.A. tables, where the cosmic noise absorption is defined by the deviation of the cosmic noise from its monthly reference level. The reference level is calculated from selected quiet diurnal variations in the month. The hourly values of the cosmic noise absorption are shown in dBm.
