

## RIOMETER RECORDS OF 30 MHz COSMIC NOISE

AT SYOWA STATION, ANTARCTICA IN 1989

Hideo MAENO and Shin-ichi YAMAMOTO

(Communications Research Laboratory, Koganei-shi, Tokyo 184)

### 1. Introduction

At Syowa Station, Antarctica, absorption of cosmic radio noise has been observed with a standard riometer (relative ionospheric opacity meter) at 30 MHz, since February 1966. The organization responsible for these observations is Communications Research Laboratory. This report presents data observed during the period from January 1 to December 31, 1989, in the format of hourly values and raw data plots. In the raw data plots, other observation data than riometer observation are also presented for reference. These data include HF, Mg, VLF and radar observations. Copies of digital MT are available to users on request. The request should be addressed to:

Communications Research Laboratory

Ministry of Posts and Telecommunications

2-1, Nukui-Kitamachi 4-chome, Koganei-shi

Tokyo 184, Japan.

### 2. Location

Syowa Station			
Geographic		Geomagnetic	
Latitude	Longitude	Latitude	Longitude
69°00' S	39°35' E	-70.0°	80.2°

### 3. Observer

Shin-ichi YAMAMOTO (Communications Research Laboratory)

#### 4. Instrumentation

The receiver of the riometer which has a center frequency of 30 MHz and a band width of 7.5 kHz is connected to a vertically directed five-element Yagi antenna whose elements are oriented in the east-west direction. The antenna is designed to match a 50 ohm coaxial transmission line (8D-2V) of 80 m in length.

Noise from a reference noise diode with power levels of 0, 1, 2, 3 and 4 dB is added once a day at 8h in 45° EMT (Eastern Meridian Time: UT + 3 hours). The data are recorded by digital recorder on MT.

The receiver having a band width of 3.5 kHz was used before 20h in 45° EMT on January 17, 1987.

#### 5. Remarks

The cosmic noise power level shows a remarkable sidereal diurnal variation caused by the passage of the cosmic radio source across the zenith. According to the revolution of the earth, the time (local time) when the same cosmic radio source passes the zenith becomes earlier about 4 minutes a day and returns to its initial value after a year. If the ionosphere is in a quiet condition, the diurnal variation of the cosmic noise power is easily extracted from the record.

The hourly values of ionospheric absorption given in the CNA (Cosmic Noise Absorption) tables are the deviations (in dB) of cosmic noise intensity from the reference sidereal diurnal variation. The reference sidereal diurnal variation is determined from the diurnal variations on several selected quiet days in each month.

After March 2, the data plots include, not only cosmic noise intensity but also geomagnetic H-component, HF and VLF propagation, and VHF radar data at Syowa Station. In the figure, the H-component increases upward and the calibration signals are added at each hour as a depression by 200 nT. About details for the information of other data, please ask to CRL.
