

RECORDS OF RADIO AURORA AT SYOWA STATION,

ANTARCTICA IN 1990

Kazuhiro OHTAKA and Kiyoshi IGARASHI

(Communications Research Laboratory, Koganei-shi, Tokyo 184)

1. Introduction

This report presents a summary of data obtained during the period of 1990 with the auroral radar at Syowa Station, Antarctica. Three kinds of data are available; a) chart records of the time variation of echo intensity, b) digital MT, c) 35 mm film records of radio auroral echo intensity (A-scope) and range-time intensity (A'-scope).

Inquiries about details of the data should be addressed to:

Antarctic Research Section
Communications Research Laboratory
Ministry of Posts and Telecommunications
2-1, Nukui-Kitamachi 4-chome, Koganei-shi
Tokyo 184, Japan

2. Location

Syowa Station

Geographic		Geomagnetic	
Latitude	Longitude	Latitude	Longitude
69° 00' S	39° 35' E	70.0° S	80.2° E

3. Observer

Kazuhiro OHTAKA (Communications Research Laboratory)

4. Equipments

The main parameters of Syowa Station auroral radar are shown in Table 1. The three antenna beams with the half power width about 4 degrees are directed toward the geomagnetic south, 32.8° west from the geomagnetic south, and 47.0° east from the geomagnetic south respectively. In 1990 two antennas directed to the geomagnetic south and 32.8° west from the geomagnetic south were used mainly. These two antennas are switched alternately. The details of the data processing and radar system are described in the reference.

Table 1. Parameters of the Syowa Station Auroral Radar

Site	Syowa Station ($69^\circ 00' S$, $39^\circ 35' E$)
Type	Coherent pulse radar
Frequency	50, 112 MHz
Peak Power	15 kW
Pulse width	$100 \mu s$
PRF	50 Hz (333 Hz for spectrum observation)
Antenna	Three 14-element coaxial collinear (three-way)
Antenna gain	25 dB
Antenna beamwidth	4° (half power) in horizontal plane
Receiver bandwidth	10 kHz
Receiver noise figure	less than 4 dB
Display and recorder	A - scope display, A' - scope display, pen recorder and digital MT

4. Explanation of Diagrams

The backscattered power intensities observed with the 50 MHz auroral radar were sampled every 1 second and stored by the digital data logger. Figure 1 shows radio auroral intensities obtained from the records with this data logger during the period of 1990.

The blank shows a lack of observations caused by the recording troubles and so on.

Figure 2 shows a summary plot of intensity and spectrum records with the 50 MHz auroral radar.
