### 昭和基地周辺の湖沼水のモニタリング

村山治太<sup>1)</sup>・綿抜邦彦<sup>2)</sup>・中谷 周<sup>3)</sup>・久保田秀紀<sup>4)</sup>・鳥居鉄也<sup>5)</sup>

**要旨：**昭和基地付近の露岩地帯には多数の湖沼が存在し、その溶存塩の濃度も広い範囲にまたがっている。塩化物イオン濃度で溶存塩の多寡を示すと、最低値 1.3 mg/l, 最大値 210 g/l (20°C の密度 1.223) である。これら溶存している塩類の供給源はさまざまであり、夏季には生物活動が盛んな湖沼も多い。これら湖沼の水質が長年月にどのように変動するかは、地球化学的立場から興味がある。また、これら湖沼に対して昭和基地を中心に活動する人の影響がどのように現れるかを知るために、環境科学の立場から、次の 5 つの湖沼を地球化学的継続観測定点に選び、モニタリングをはじめた；水汲み沢（東オングル島）、大池（西オングル島）、ぬるめ池（ラングホブデ）、舟底池（スカルブスネス）、スカーレン大池（スカーレン）。これらの池は 1) 接近・採水がしやすく、2) 基地からの距離が適当であり、3) 複数の人が調査し、結果が公表されている、などの理由から選ばれた。現在までに知り得た化学成分の組成を表に示す。

**Abstract:** Since 1957 with the commencement of the activities of the Japanese Antarctic Research Expedition, geochemical investigations of lakes in the vicinity of Syowa Station have been carried out. There are various kinds of lakes in the chemical composition of water. As to the chloride ion, its concentration ranged from 1.3 mg/l to 210 g/l. It is one of the interesting problems to pursue the long-term change of chemical composition of water in the various lakes relating to the change of the meteorological conditions. The long-term observation

of lake water also contributes to the monitoring of human impacts on the natural environment. Five lakes were selected as the objects for the long-term geochemical observation, which started in the 1978 winter season. The data collected up to 1978 on the five lakes were compiled.

There are many lakes in the ice-free areas near Syowa Station ( $69^{\circ}00'S$ ,  $39^{\circ}35'E$ ). Since 1957 when the scientific research by the Japanese Antarctic Research Expedition (JARE) commenced, the limnological studies were carried out to get the general knowledge on the inland lakes of Antarctica and also to clarify the geochemical processes in the lakes of the Syowa Station area. The results obtained were already reported by SUGAWARA and TORII (1959), MINAMI *et al.* (1961), MEGURO (1962), WATANUKI (1962), HIGANO (1977), MURAYAMA (1977), SANO *et al.* (1977), HIRABAYASHI and OSSAKA (1977), WATANUKI *et al.* (1977) and KARASAWA and FUKUSHIMA (1977).

MURAYAMA (1977) reported that the chloride ions contained in the lake waters varied considerably, ranging from  $1.3\text{ mg/l}$  to  $210\text{ g/l}$ , and pointed out that most of the saline lakes of this region seemed to be relict lakes. Consequently, the present water and chemical components of the lakes were mainly supplied by the melt water of the snow drift and by the snow itself. The salts in the lake waters were mainly supplied by the air-borne salts. Chemical compounds in some lakes may be derived from the rock and sand. Therefore, it is expected that the concentration of salts in the lake water varies depending upon the long-term change of the meteorological conditions. It is one of the interesting problems to observe such variation of chemical components of the lake waters as mentioned above. For this observation, it is desirable that different kinds of lakes are comparatively dealt with.

The human impact on the natural environment possibly increases corresponding to the expansion and duration of the research activities. To monitor the effects of human activities the long-term observation of lakes must be useful. For this purpose, it is advantageous to select the lakes which are exposed to the various degrees of impact.

Furthermore, it is hoped that the sampling sites should be accessible to continue the observation. To study the data which will be acquired in the future it would be helpful to select the lakes on which background information is available.

Considering the requirements mentioned above, Mizukumi Stream, Lake

\* S: Samples were collected from the lake shore. Depth of the sampling ranges was 0-20 cm.

The lake water was not covered with ice-sheet.

Ô-ike, Lake Nurume, Lake Hunazoko and Lake Skallen Ôike were selected according to the distance from Syowa Station as the long term geochemical observation sites (Fig. 1 and Table 1). Mizukumi Stream, Lake Ô-ike and Lake Skallen Ôike are of fresh water and the others are saline. Geochemical data on five lakes obtained by the previous workers are summarized in Tables 2 to 6. At the present state of the knowledge on the lake waters, it is difficult to mention the variation in the chemical components of the waters. Further continuous observation is necessary.
