

# SEISMOLOGICAL BULLETIN OF SYOWA STATION, ANTARCTICA, 1992

Masaki KANAOK

National Institute of Polar Research,  
9-10, Kaga 1-chome, Itabashi-ku, Tokyo 173

## 1. Introduction

The seismic observation system at Syowa Station is schematically illustrated in Fig. 1. There are two types of seismometers, one called SP (short-period) or HES with 1.0 s natural period of the pendulum and the other called LP (long-period) or PELS with 12.0 s natural period. The SP and LP have been operated since 1961 and 1967, respectively (Kaminuma *et al.*, 1968). A new vault for seismometers was built in March 1970 (Kaminuma and Chiba, 1973). The old type of LP seismometer (Press-Ewing) was replaced by a PELS at Syowa Station in 1982. The overall frequency response and the magnification of the short-period and long-period seismometers (Z, N-S and E-W components) are shown in Fig. 2. The coordinates of the seismographic vault are 69°00'31.7"S, 39°35'31.6"E. The elevation is 20 m above mean sea level.

A three-component Streckeisen Seismometer (STS) was installed in April 1989 at Syowa Station for broad-band digital seismographs, based on the recommendation from the Working Group of Solid Earth Geophysics of SCAR (Scientific Committee on Antarctic Research). The block diagram of the recording system is illustrated in Fig. 3. The STS system has two different outputs, Broad-Band (BRB) and Long-Period (LP). The digital recording system started BRB output in May 1990 (Nagasaka *et al.*, 1992), and LP output in February 1992. The amplitude and phase responses for BRB output of the STS seismometer are shown in Fig. 4. The BRB output has a flat frequency response for velocity from 0.1 s to 20 s in the 20-s mode and from 0.1 s to 360 s in the 360-s mode, respectively. The LP output has a flat response to acceleration for periods longer than 20 s.

All of these systems were maintained by the author throughout the wintering season of JARE-33 (February 1992 - January 1993). Observations by the STS system were mainly carried out in the 20-s mode for the vertical component, and in the 360-s mode for the horizontal components.

## 2. Data

Considering the delay time of 1-2 years between the publication of this report and the observing wintering period, which is inevitable since the resupply ship visits Syowa Station only once a year, the PDE (Preliminary Determination of Epicenters) reports by NEIC (National Earthquake Information Center) are referred to and only the seismograms of teleseismic events are edited.

The system clock has been connected to the recovered UTC from the NNSS (Navy Navigation Satellite System) since February 1987 (see Fig. 1). The accuracy of the read-out data can be estimated as 0.2 s. Testing measurement to receive UTC by GPS (Global Positioning System) satellites instead of NNSS was conducted during the wintering season of JARE-33 (see Fig. 3).

### 2.1. Read-out data

The onsets of the teleseismic events were detected on the SP monitoring seismograms and picked out from the pen-monitor records. The arrival times of P- and S- phases are listed in Table 1. Most phases were scaled on the vertical component, and only clear phases were on the horizontal components. The phase K denotes the PKP phase and X is the clear phase but its wave type cannot be identified. Symbols E and I in the phase column denote emergent and sharp onsets, respectively. The direction of the initial ground motion is denoted by + for upward and - for downward. Arrival time is represented in UTC.

The teleseismic events reported in the PDE are identified by serial numbers (#-xxx) in the table. The serial numbers correspond to the numbers in Table 2 which list the big events detected at Syowa Station and reported in the PDE. The events without serial numbers are teleseisms whose locations have not been determined by NEIC.

### 2.2. Teleseismic events

Figure 5 shows the location of 614 teleseismic events of which initial phases were detected at Syowa Station. The list of hypocenters of the teleseisms is shown in Table 2 with the same serial numbers as given in the remarks of Table 1. The seismograms of these events are available from the author.

The digital records of BRB outputs of STS seismographs for some large events are given in the Appendix. The digital records of these events can be distributed upon request. The three-component seismograms are shown and the scale of amplitude in the Appendix is arbitrary. The serial number of each output is in Table 2. The starting time of each seismogram is given at the top left of each panel.

### 3. Data Processing Staff

The seismic observations at Syowa Station are organized by the author, K. Kaminuma, and K. Shibuya of the National Institute of Polar Research. Information on the seismic observation at Syowa Station is available from them. Mr. I. Karakama of the National Institute of Polar Research has scaled and edited all events, and Ms. M. Minegishi has prepared this manuscript. The author expresses his thanks for their cooperation.
